

SQL Dataset Analysis

A structured exploration of Swiggy's operational data through advanced SQL queries — enabling strategic insights, customer intelligence, and data-driven decision-making across the business.

Presented by Bhoopendra Singh

COMPANY OVERVIEW

About Swiggy

Founded

2014, Bengaluru — now
India's leading on-demand
delivery platform

Scale

500+ cities, 300K+
restaurants, and millions of
daily orders

Mission

Making everyday life convenient through hyperlocal delivery

The SQL Dataset

This analysis is built on Swiggy's relational dataset, comprising five core tables that capture the full order lifecycle.

Customers

Customer ID, name, city, and contact details

Restaurants

Restaurant ID, name, city, and ratings

Orders

Order records linking customers, restaurants, and dates

Delivery Partners

Partner ID, name, and delivery completion records

1.Customer Analysis by Location

Display all customers who live in Delhi.

MySQL

SQL QUERY

```
#1. Display all customers who live in 'Delhi'.  
select name, city  
from customers  
where city ="Delhi";
```

OUTPUT REVIEW

Result Grid			Filter Rows:
	name	city	
▶	Rohini Verma	Delhi	
	Manish Kumar	Delhi	
	Sonali Mishra	Delhi	

Business insights Helps the business identify and target customers in the Delhi region for local marketing campaigns.

2. Restaurant Rating Analysis in Mumbai

Find the average rating of all restaurants in Mumbai.

MySQL

SQL QUERY

```
#2. Find the average rating of all restaurants in 'Mumbai'.  
select avg(rating)  
from restaurants  
group by city  
having city='Mumbai';
```

OUTPUT REVIEW

Result Grid

	avg(rating)
▶	4.300000

Business insights Shows overall restaurant performance and customer satisfaction in Mumbai.

3.Active Customers Report

List all customers who have placed at least one order.

MySQL SQL QUERY

#3. List all customers who have placed at least one order.

```
select c. name, count(o. customer_id) count_order
from customers c
join orders o
using(customer_id)
group by customer_id
having count(o. customer_id)>=1;
```

OUTPUT REVIEW

Result Grid

Filter Rows:

	name	count_order
▶	Amit Sharma	2
	Rohini Verma	3
	Rajesh Gupta	3
	Sneha Mehta	2
	Manish Kumar	4
	Priya Singh	3

Business insights Helps identify active customers who are engaging with the platform.

4.Customer Order Count Analysis

Display the total number of orders placed by each customer.

MySQL SQL QUERY

```
#4 Display the total number of orders placed by each customer.  
select c. name, count(o. customer_id) count_order  
from customers c  
join orders o  
using(customer_id)  
group by customer_id  
order by count(o. customer_id);
```

OUTPUT REVIEW

Result Grid   Filter Rows:		
	name	count_order
▶	Suresh Nair	1
	Karan Kapoor	1
	Amit Sharma	2
	Sneha Mehta	2
	Kavita Deshmukh	2
	Vivek Bhatt	2

- **Business insights** Helps the company identify loyal and high-frequency customers.

5. Restaurant Revenue Analysis

Find the total revenue generated by each restaurant.

MySQL

SQL QUERY

```
#5. Find the total revenue generated by each restaurant.  
select r. name , sum(o. total_amount) total_revenue  
from restaurants r  
join orders o  
using(restaurant_id)  
group by restaurant_id;
```

OUTPUT REVIEW

Result Grid Filter Rows:		
	name	total_revenue
▶	Biryani House	5300.00
	Taste of Punjab	600.00
	Spice of India	1100.00
	Coastal Delight	2100.00
	Tandoori Flames	1200.00
	Curry Pot	3200.00

Business insights Total Revenue Generated by Each Restaurant
Helps measure which restaurants contribute the highest sales to the business.

6.Top Rated Restaurants Analysis

Find the top 5 restaurants with the highest average rating.

 MySQL

SQL QUERY

#6. Find the top 5 restaurants with the highest average rating.

SELECT

name, rating

FROM

restaurants

ORDER BY rating DESC

LIMIT 5;

OUTPUT REVIEW

Result Grid

Filter Row

	name	rating
▶	Biryani House	4.80
	Paradise Biryani	4.80
	Lucknowi Nawabi	4.70
	Royal Biryani	4.70
	Flavours of Bengal	4.60

Business insights Helps promote top-performing restaurants and improve customer trust.

7.Inactive Customers Report

Display all customers who have never placed an order.

MySQL SQL QUERY

#7. Display all customers who have never placed an order.

```
SELECT
  c.name
FROM
  customers c
  JOIN
  orders o USING (customer_id)
WHERE
  order id IS NULL;
```

OUTPUT REVIEW

Result Grid			
	name		

Business insights Helps target inactive customers with offers and promotional campaigns.

8.Mumbai Customer Order Analysis

Find the number of orders placed by each customer in Mumbai.

SQL QUERY

```
#8. Find the number of orders placed by each customer in 'Mumbai'.  
SELECT  
    c.name, COUNT(o.customer_id)  
FROM  
    customers c  
    JOIN  
    orders o USING (customer_id)  
WHERE  
    city = 'Mumbai'  
GROUP BY o.customer_id;
```

OUTPUT REVIEW

Result Grid  Filter Rows: 		
	name	count(o. customer_id)
▶	Amit Sharma	2
	Rajesh Gupta	3
	Arjun Desai	2
	Ravi Singh	2

Business insights Helps understand customer ordering behavior in the Mumbai market..

9.Recent Orders Analysis

Display all orders placed in the last 30 days.

MySQL

SQL QUERY

#9. Display all orders placed in the last 30 days.

SELECT

order_id

FROM

orders

WHERE

order_date BETWEEN DATE_SUB(NOW(), INTERVAL 30 DAY) AND NOW();

OUTPUT REVIEW

Result Grid

order_id

NULL

Business insights Helps track recent business activity and current customer demand trends.

10.Delivery Partner Performance Report

List all delivery partners who have completed more than 1 delivery.

MySQL

SQL QUERY

```
#10. List all delivery partners who have completed more than 1 delivery
SELECT
d.name, COUNT(od.partner_id) no_delivery
FROM
  deliverypartners d
  JOIN
    orderdelivery od USING (partner_id)
GROUP BY od.partner_id
HAVING COUNT(od.partner_id) > 1;
```

OUTPUT REVIEW

Result Grid Filter Rows:		
	name	no_delivery
▶	Amit Sharma	2
	Ravi Kumar	5
	Priya Patel	3
	Suresh Reddy	6
	Anita Desai	4

Business insights Helps identify active delivery partners contributing regularly to operations.

11.Customer Ordering Pattern Analysis

Find customers who have placed orders on exactly three different days.

MySQL

SQL QUERY

```
#11 Find the customers who have placed orders on exactly three different days. unsolved
SELECT
  c.name, COUNT(DISTINCT order_date)
FROM
  customers c
  JOIN
  orders o USING (customer_id)
GROUP BY c.name
HAVING COUNT(DISTINCT order_date) = 3;
```

OUTPUT REVIEW

Result Grid Filter Rows:		
	name	COUNT(DISTINCT order_date)
	Ashok Kumar	3
	Nidhi Saxena	3
	Priya Singh	3
	Rohini Verma	3

Business insights Helps analyze customer engagement and repeat purchase behavior.

12.Top Delivery Partner Analysis

Find the delivery partner who has worked with the most different customers.

MySQL SQL QUERY

```
SELECT
    dp.name, COUNT(DISTINCT o.customer_id) AS Total_Customers
FROM
    deliverypartners dp
    JOIN
        orderdelivery od ON dp.partner_id = od.partner_id
    JOIN
        orders o ON od.order_id = o.order_id
GROUP BY dp.partner_id , dp.name
ORDER BY COUNT(DISTINCT o.customer_id) DESC
LIMIT 1;
```

OUTPUT REVIEW

Result Grid  Filter Rows:		
	name	Total_Customers
▶	Suresh Reddy	6

Business insights Helps identify the most experienced and widely engaged delivery partner.

13. Customer and Restaurant Matching Analysis

Identify customers who belong to the same city and ordered from the same restaurants on different dates.

MySQL

SQL QUERY

```
SELECT DISTINCT
  c1.name AS customer_1,
  c1.city,
  r.name AS restaurant_name,
  DATE(o2.order_date) AS second_order_date
FROM
  Orders o1
  INNER JOIN
  Orders o2 ON o1.restaurant_id = o2.restaurant_id
  AND DATE(o1.order_date) <> DATE(o2.order_date)
  INNER JOIN
  Customers c1 ON o1.customer_id = c1.customer_id
  INNER JOIN
  Customers c2 ON o2.customer_id = c2.customer_id
  INNER JOIN
  Restaurants r ON o1.restaurant_id = r.restaurant_id
WHERE
  c1.city = c2.city;
```

OUTPUT REVIEW

Result Grid

Filter Rows:

Export:

	customer_1	city	restaurant_name	second_order_date
▶	Rohini Verma	Delhi	South Treat	2024-08-10
	Vivek Bhatt	Indore	Curry Pot	2024-08-11
	Meera Joshi	Jaipur	Rajasthani Rasoi	2024-08-08
	Manish Kumar	Delhi	Biryani House	2024-08-05
	Manish Kumar	Delhi	Biryani House	2024-08-07

Business insights Helps understand customer preferences and regional food ordering pattern.

Conclusion

- SQL queries helped analyze customers, restaurants, orders, and delivery performance.
- The analysis provided useful business insights for better decision-making.
- Overall, SQL is an effective tool for managing and understanding food delivery data.

THANK
YOU
